Introduction

This report has been produced for the region/s of: Americas

The studies included within this report are shown in Table 0.

Treatment code describes (schizontocidal drug)(hypnozoitocidal drug)(total primaquine dose)(duration of primaquine treatment eg 14d = 14 days)(primaquine start day)

1: EFFICACY

1.1: Description

The efficacy study was undertaken to better understand the impact of primaquine dose on the prevention of P. vivax recurrences. Inclusion in the efficacy meta-analysis was restricted to studies with 42 days or more follow up and patients with data on day 0 parasitaemia.

In this report the efficacy study includes 1171 patients across 21 study sites, from 10 studies.

1.2: Characteristics of Study Population

Table 1_eff: Characteristics of the study population for the efficacy study analysis, categorised by total primaquine category

	Primaquine (PQ) Treatment				
	No primaquine (N=119)	Very low dose total primaquine (<2 mg/kg)(N=15)	Low dose total primaquine (2 - <5 mg/kg)(N=849)	High dose total primaquine (>= 5 mg/kg)(N=188)	Total (N=1171)

1.3: Risk of recurrence

Kaplan-Meier survival analysis was used to calculate risk of recurrence between day 7 and 365. Patients were left censored at day 7 and right censored at the first of: the day last reviewed, the last day prior to a 60-day blood smear gap or the last day of study follow up. Outcomes were stratified by primaquine treatment arm: no primaquine, low total dose primaquine (2 to <5 mg/kg) and high total dose primaquine (≥5 mg/kg). Very low total dose primaquine (≥2 mg/kg) was not presented due to low numbers of patients treated with this dose.

Figure 0_eff: Kaplan-Meier figure of cumulative risk of recurrence between day 7 and day 365 for primaquine treatment category. Please interpret the results of this figure with caution as there may not always be paired treatment comparisons in the original studies contributing to these pooled results.

Cox regression analysis for the time to first vivax recurrence between day 7 and 180 was performed to determine the effect of primaquine dose. Analysis was restricted to patients treated with daily primaquine or no primaquine. Potential confounders including sex, age and baseline parasitaemia were adjusted for with shared frailty for study site.

Similar but separate multivariable Cox regression analyses were undertaken to investigate primaquine duration, also adjusting for total actual mg/kg dose, in i) patients treated with low total dose primaquine and ii) patients treated with high total dose primaquine.

Care should be taken when interpreting these results, as model assumptions have not been fully assessed in this automated report format.

Figure 1_eff: Hazard ratio between day 7 and day 180 for A: total dose of primaquine and B: 14-day vs 7-day primaquine duration, stratified by total dose of primaquine

2: HAEMATOLOGY

2.1: Description

Haematological safety is a key concern for clinicians and policymakers in the implementation of primaquine radical cure, due to the risk of haemolysis in patients with G6PD deficiency. This individual patient data meta-analysis was conducted to assess the evidence for adverse haematological outcomes related to primaquine dose, with consideration of patients G6PD status.

Inclusion in the haematological safety meta-analysis was restricted to studies with 28 days or more follow up, patients with data on day 0 parasitaemia, patients with available data on day 0 haemoglobin levels or haematocrit, patients with an available haemoglobin measurement on at least one more day during the follow-up period and patients with data on daily primaquine dose.

The haematology study included 393 patients across 10 study sites, from 4 studies.

2.2 Characteristics of Study Population

Table 1_saf: Characteristics of the study population for the safety study analysis, categorised by total primaquine category

		Primaquine	Treatment		
	No primaquine (N=119)	Low dose daily primaquine (<0.375 mg/kg/day) (N=180)	Intermediate dose daily primaquine (>= 0.375 & <0.75 mg/kg/day) (N=90)	High dose daily primaquine (>= 0.75 mg/kg/day) (N=4)	Total (N=393)

2.4: Change in Haemoglobin (Hb) levels between primaquine treatment groups

The following figure provides the estimated change in haemoglobin from day 0 for different primaquine doses at at day 2/3 and days 5/7, adjusted for baseline haemoglobin, age, sex and day 0 parasitaemia and allowing for clustering by study site, in participants with $\geq 30\%$ G6PD activity.

Care should be taken when interpreting these results, as model assumptions have not been fully assessed in this automated report format.

Figure 1_saf: The covariate-adjusted estimated change in Hb between primaquine daily dose groups on (A) days 2-3 and (B) days 5-7, in patients with $\geq 30\%$ G6PD activity.

3: TOLERABILITY

3.1: Description

This individual patient data meta-analysis was conducted in order to understand the effect of primaquine dose on the gastrointestinal side effects.

Inclusion in the gastrointestinal tolerability meta-analysis was restricted to studies with 28 days or more followup, data from pre-specified symptom questionnaires (symptom checklist), patients with data on vivax parasite count at baseline, patients starting primaquine by day 2, patients not receiving intermittent primaquine (defined as primaquine administered weekly or monthly, rather than daily) and patients with data on daily primaquine dose.

The tolerability study included 417 patients across 12 study sites, from 5 studies.

Characteristics of Study Population

Table 1_tol: Characteristics of the study population for the tolerabilty study analysis, categorised by total primaquine category

3.3 Summary of the gastrointestinal tolerability outcomes

The primary endpoint for this analysis was a composite indicator including the presence of vomiting or anorexia or diarrhoea on days 5-7 after enrolment.

Secondary endpoints for this analysis were:

a) the presence of vomiting, nausea, a norexia, abdominal pain, diarrhoea or dizziness assessed separately on days $5\text{-}7^1$ b) the presence of the composite endpoint including vomiting or anorexia or diarrhoea on day 0, days 1-2 and days 5-7, assessed separately

¹Assessment of nausea, dizziness and abdominal pain was restricted to patients older than 5 years Table 2 provides a summary of the outcome experienced within each Primaquine treatment arm.

Table 2_tol: Summary of gastrointestinal outcomes, categorised by total primaquine category

Outcomes include participants of al Composite on day 0 No Yes Composite between days 1-2	(N=0) NA NA	Low dose daily primaquine (<0.375 mg/kg/day) (N=244) 61 (25.0 %) 183 (75.0 %)	Intermediate dose daily primaquine (0.375 & <0.75 mg/kg/day) (N=169) 51 (30.2 %)	High dose daily primaquine (0.75 mg/kg/day)	Total (N=417)
Composite on day 0 No Yes Composite between days 1-2	(N=0) NA NA	61 (25.0 %)	,	(N=4)	(N=417)
No Yes Composite between days 1-2	NA NA	61 (25.0 %)	,	(N=4)	(N=417)

Figure 1_tol: Distribution of primaquine daily dose by primaquine mg/kg daily dose category. Primaquine daily dose categories: Low: <0.375 mg/kg/day, Int (intermediate): ≥ 0.375 mg/kg/day and <0.750 mg/kg/day, and High: ≥ 0.750 mg/kg/day

3.4: Risk of gastrointestinal intolerance

The risk of gastrointestinal intolerance on days 5-7 was calculated from the number of patients reporting the composite outcome as a proportion of the total number of patients asked about each of the individual components of the composite; i.e. those asked about vomiting or anorexia or diarrhoea on any day between days 5-7. The 95% confidence intervals (CIs) for the risks were calculated as exact binomial CIs. The risks were stratified by primaquine daily dose categories

Figure 2_tol: Risk of gastrointestinal intolerance by symptoms. For each outcome the risk was estimated as the number of individuals experiencing the symptom as a proportion of the number of individuals asked about the symptom on any day between days 5-7. The confidence intervals (CIs) are exact binomial CIs.

$3.4.1 \colon$ Adjusted association between primaquine daily dose categories and gastrointestinal intolerance days 5-7

Covariate-adjusted estimated proportion of patients with gastrointestinal symptoms on days 5–7 cannot be presented as there were no records for any gastrointestinal intolerances (experienced or not experienced) for the refrence group (no primaquine)

3.4.2: Risk of Acute Vomiting on days 0-2 and 3-13

Days 0-2

The unadjusted risk of vomiting within an hour of primaquine administration (acute vomiting) was calculated on days 0-2 and days 3-13 for each primaquine dose group.

Table 3_tol: Risk of acute vomiting on days 0-2 and 3-13 by primaquine daily dose categories

	Risk of acute vomiting		
Primaquine treatment	Days 0-2	Days 3-13	
Low dose daily primaquine (<0.375 mg/kg/day) Intermediate dose daily primaquine (>=0.375 & <0.75 mg/kg/day) High dose daily primaquine (>=0.75 mg/kg/day)	1/61 (1.6%) 0/1 (0.0%) 0/0 (NaN%)	0/0 (NaN%) 0/0 (NaN%) 0/0 (NaN%)	

	N	Percentage (95% CI)		N	Percentage (95% CI)
Low dose PQ	61	1.64 (0.04, 8.80)	Low dose PQ	0	No records for this outcome
Intermediate dose PQ	1 •	0.00 (0.00, 97.50)	Intermediate dose PQ	0	No records for this outcome
High dose PQ	0	No records for this outcome	High dose PQ	0	No records for this outcome
	0.0 0.5 1.0 1.5 2.0 2.5 3.0 Percentage			0.0 0.5 1.0 1.5 2.0 2.5 3.0 Percentage	

Days 3-13

Figure 3_tol: Risk of acute vomiting on days 0-2 and 3-13 by primaquine daily dose categories. The confidence intervals (CIs) are exact binomial CIs.
